U6614: Assignment 3: Subway Fare Evasion Microdata

Sample Solution

2020-09-27

Please submit your knitted .pdf file along with the corresponding R markdown (.rmd) via Courseworks by 11:59pm on Monday, September 28th.

Before knitting your rmd file as a pdf, you will need to install TinyTex for Latex distribution by running the following code:

```
tinytex::install_tinytex()
```

Please visit this link for more information on TinyTex installation.

1 Load libraries

```
#remember to make sure these packaged are installed before trying to load
library(tidyverse)
library(fastDummies)
```

2 Load and inspect the two public defender client datasets (BDS & LAS)

```
arrests_bds <- read_csv("microdata_BDS_inclass.csv", na = "")
arrests_las <- read_csv("microdata_LAS_inclass.csv", na = "")

str(arrests_bds)
```

```
## tibble [2,246 x 8] (S3: spec_tbl_df/tbl_df/tbl/data.frame)

##   .. )
```

The BDS data includes 2246 observations (client arrest records), and the LAS data includes another 1965 observations. Both datasets include basic demographic information on age, sex, race, ethnicity (coded differently in each dataset), as well as information on the location/subway station where the arrest occurred.

The LAS data also includes information on case dismissal rates.

2.1 For each dataset, what is the unit of observation and representative population?

In each raw dataset, the unit of observation is the arrested individual (client). On the surface, the representative population is all individuals arrested by the NYPD for subway fare evasion in Brooklyn during 2016 who are represented by public defenders. If nearly all individuals arrested for fare evasion are represented by public defenders, then this sample comes close to constituting the universe of subway fare evasion arrests in Brooklyn in 2016. This is difficult to argue convincingly without additional information, but is supported anecdotally by court observers.

2.2 Inspect and describe the coding of race/ethnicity in each dataset.

```
#recode race/ethnicity information from character to factors
arrests_bds <- arrests_bds %>% mutate(race = as.factor(race),
                                      ethnicity = as.factor(ethnicity) )
arrests_las <- arrests_las %>% mutate(race = as.factor(las_race_key),
                                      ethnicity = as.factor(hispanic_flag) )
#compare race coding
  summary(arrests_bds$race)
```

```
##                     0             Am Indian Asian/Pacific Islander
##                    35                     1                    21
##                 Black                 Other               Unknown
##                  1465                    32                     2
##                 White                  NA's
##                   533                   157

## 1619  189  157
```

Race information is generally stored in one variable, Hispanic identity in a second variable. To work towards consistent variable names and coding in both datasets, let's first recode the raw race and ethnicity information into two separate columns of data (factors) named `race` and `ethnicity`.

While each dataset refers to similar race and ethnicity categories, there are different category names in each (including some slightly different spellings).

We also note that Hispanic identity factors into both race and Hispanic variables in the Legal Aid Society (LAS) data; in the BDS data, information on Hispanic identity is only included in the ethnicity variable.

Each dataset also contains a different set of values that seem to convey unknown race/ethnicity information, in addition to true missings (e.g. "0" and "Unknown" in addition to blank entries).

2.3 From the outset, are there any data limitations you think are important to note?

It's unclear what processes are used to code race and ethnicity at each public defender group. How much does the information reflect client self-identification rather than identity assigned by police and entered into arrest reports?

It's also important to emphasize what information this data does **not** include that might be relevant to the question of biased fare evasion enforcement:

- fare evasion that resulted in a summons (ticket + fine) rather than an arrest
- fare evasion enforcement on buses

3 Clean BDS race and ethnicity data

3.1 BDS: race data (generate column `race_clean`).

```
#identify every combination of race-ethnicity in the raw data
table(arrests_bds$race, arrests_bds$ethnicity, useNA = "always")
```

```
##
##                            0 Hispanic Non-Hispanic Other <NA>
##   0                       31        1            3     0    0
##   Am Indian                0        0            1     0    0
##   Asian/Pacific Islander   0        0           21     0    0
##   Black                    2      104         1358     1    0
##   Other                    0       20           11     1    0
##   Unknown                  0        0            0     2    0
##   White                    0      368          164     1    0
##   <NA>                     0        0            0     0  157
```

```
#recode as factor in an internally consistent manner (address NAs, specify levels)
arrests_bds.clean <- arrests_bds %>%
  mutate(race_clean = recode(race, "0" = "NA",
                                   "Unknown" = "NA",
                                   "Am Indian" = "Other" ) )  %>%
  mutate(race_clean = factor(race_clean,
                             levels = c("Black", "White", "Asian/Pacific Islander", "Other")))

#validation: confirm the recode worked as intended
levels(arrests_bds.clean$race_clean)
```

```
## [1] "Black"                  "White"                  "Asian/Pacific Islander"
## [4] "Other"
```

```
arrests_bds.clean %>% count(race_clean, sort = TRUE)
```

```
## # A tibble: 5 x 2
##   race_clean                n
##   <fct>                 <int>
## 1 Black                  1465
## 2 White                   533
## 3 <NA>                    194
## 4 Other                    33
## 5 Asian/Pacific Islander   21
```

```
table(arrests_bds.clean$race_clean, arrests_bds.clean$race, useNA = "always")
```

```
##
##                            0 Am Indian Asian/Pacific Islander Black Other
##   Black                    0         0                     0  1465     0
##   White                    0         0                     0     0     0
##   Asian/Pacific Islander   0         0                    21     0     0
##   Other                    0         1                     0     0    32
##   <NA>                    35         0                     0     0     0
##
##                           Unknown White <NA>
##   Black                       0     0    0
##   White                       0   533    0
```

```
##   Asian/Pacific Islander       0     0    0
##   Other                        0     0    0
##   <NA>                         2     0  157
```

3.2 BDS: ethnicity data (generate column `ethnicity_clean`).

```
#ok now let's recode to Hispanic, Non-Hispanic, and NA
arrests_bds.clean <- arrests_bds.clean %>%
  mutate(hispanic = recode(ethnicity, "O" = "NA", "Other" = "Non-Hispanic") ) %>%
  mutate(hispanic = factor(hispanic, levels = c("Hispanic", "Non-Hispanic")))

#validation: confirm the recode worked as intended
  summary(arrests_bds.clean$hispanic)
```

```
##     Hispanic Non-Hispanic         NA's
##          493         1563          190
```

```
  table(arrests_bds.clean$race_clean, arrests_bds.clean$hispanic, useNA = "always")
```

```
##
##                          Hispanic Non-Hispanic <NA>
##   Black                       104         1359    2
##   White                       368          165    0
##   Asian/Pacific Islander        0           21    0
##   Other                        20           13    0
##   <NA>                          1            5  188
```

3.3 Generate a single race/ethnicity factor variable `race_eth` with mutually exclusive categories.

```
#let's investigate a bit
table(arrests_bds.clean$race_clean, arrests_bds.clean$hispanic, useNA = "always")
```

```
##
##                          Hispanic Non-Hispanic <NA>
##   Black                       104         1359    2
##   White                       368          165    0
##   Asian/Pacific Islander        0           21    0
##   Other                        20           13    0
##   <NA>                          1            5  188
```

```
prop.table(table(arrests_bds.clean$race_clean, arrests_bds.clean$hispanic), 2)  %>% round(2)
```

```
##
##                          Hispanic Non-Hispanic
##   Black                      0.21         0.87
##   White                      0.75         0.11
##   Asian/Pacific Islander     0.00         0.01
##   Other                      0.04         0.01
```

```
#generate race_eth column (as a factor) in steps
arrests_bds.clean <- arrests_bds.clean %>%
  mutate(race_clean_char = as.character(race_clean)) %>% #work with characters
  mutate(hispanic_char = as.character(hispanic))     %>% #work with characters
  mutate(race_eth = ifelse(hispanic_char == "Hispanic",
                           hispanic_char,
```

```
                           race_clean_char) ) %>%
  mutate(race_eth = as.factor(recode(race_eth, "White" = "Non-Hispanic White"))) %>%
  select(-race_clean_char, -hispanic_char)

#validate results: joint distribution of race_eth and hispanic
table(arrests_bds.clean$race_eth, arrests_bds.clean$hispanic, useNA = "always")
```

```
##
##                          Hispanic Non-Hispanic <NA>
##   Asian/Pacific Islander        0           21    0
##   Black                         0         1359    0
##   Hispanic                    493            0    0
##   Non-Hispanic White            0          165    0
##   Other                         0           13    0
##   <NA>                          0            5  190
```

```
summary(arrests_bds.clean$race_eth, useNA = "always")
```

```
## Asian/Pacific Islander                  Black               Hispanic
##                     21                   1359                    493
##     Non-Hispanic White                  Other                   NA's
##                    165                     13                    195
```

Note that `race_eth` assigns individuals who identify as both Hispanic and a race other than white as Hispanic. This means, for example, that an individual who identifies as both Black and Hispanic appears as Hispanic in the `race_eth` column.

4 Clean LAS race and ethnicity data

4.1 Follow your own steps to end up at a `race_eth` variable for the LAS data that is coded in a comparable manner as in the BDS data.

NOTE: you may be able to do everything in a single pipe, depending on your approach (but you certainly don't have to).

```
#inspect LAS data
str(arrests_las)
```

```
## tibble [1,965 x 11] (S3: spec_tbl_df/tbl_df/tbl/data.frame)

5 Combining (appending) the BDS and LAS microdata

5.1 Create a column (pd) to identify public defender data source.

```
arrests_bds.clean <- arrests_bds.clean %>% mutate(pd = "bds")
arrests_las.clean <- arrests_las.clean %>% mutate(pd = "las")
```

5.2 Append arrests_bds.clean and arrests_las.clean using rbind(). Store as new data frame arrests_all and inspect for consistency/accuracy.

```
arrests.clean <- plyr::rbind.fill(arrests_las.clean, arrests_bds.clean) %>%
  mutate(pd = as.factor(pd),
         st_id = as.factor(st_id),
         loc2 = as.factor(loc2)) %>% #station/location info is not continuous
  select(pd, race_eth, age, male, dismissal, st_id, loc2)
str(arrests.clean)
```

```
## 'data.frame':    4211 obs. of  7 variables:

5.3 What is the total number of subway fare evasion arrest records?

The total number of subway fare evasion arrest records from both BDS and LAS is 4211.

5.4 Export `arrests_all` as .csv, and save as .rds file.

```
write_csv(arrests.clean, "arrests_all.csv")
saveRDS(arrests.clean, "../Lecture4/arrests.clean.rds")
```

6 Descriptive statistics by race/ethnicity

6.1 Print the number of arrests for each race/ethnicity category (a frequency table).

```
arrests.clean %>% count(race_eth, sort = TRUE)
```

```
##                 race_eth    n
## 1                  Black 2560
## 2               Hispanic  704
## 3     Non-Hispanic White  459
## 4                   <NA>  432
## 5 Asian/Pacific Islander   32
## 6                  Other   24
```

6.2 Print the proportion of total arrests for each race/ethnicity category.

```
#including NAs
prop.table(table(arrests.clean$race_eth, useNA = "always")) %>%
  round(2) %>%
  as.data.frame() %>%
  arrange(desc(Freq)) %>%
  rename(race_eth = Var1)
```

```
##                 race_eth Freq
## 1                  Black 0.61
## 2               Hispanic 0.17
## 3     Non-Hispanic White 0.11
## 4                   <NA> 0.10
## 5 Asian/Pacific Islander 0.01
## 6                  Other 0.01
```

```
#excluding NAs
prop.table(table(arrests.clean$race_eth)) %>%
  round(2) %>%
  as.data.frame() %>%
  arrange(desc(Freq)) %>%
  rename(race_eth = Var1)
```

```
##                 race_eth Freq
## 1                  Black 0.68
## 2               Hispanic 0.19
## 3     Non-Hispanic White 0.12
## 4 Asian/Pacific Islander 0.01
```

```
## 5                  Other 0.01
```

6.3 Show the average age, share male, and dimissal rate for each race/ethnicity category. Describe any noteworthy findings.

```
arrests.clean %>%
  group_by(race_eth) %>%
  summarise(n = n(),
            mean_age = mean(age, na.rm = TRUE),
            mean_male = mean(male, na.rm = TRUE),
            mean_dism = mean(dismissal, na.rm = TRUE))
```

```
## # A tibble: 6 x 5
##   race_eth                    n mean_age mean_male mean_dism

7.3 Briefly summarize any noteworthy findings from the table you just generated.

At every single high-arrest subway station, the majority of arrested individuals are Black or Hispanic. This isn't surprising, given that 87 percent of *all* arrested individuals with coded race/ethnicity are Black or Hispanic.

7.4 (OPTIONAL) Visualize the distribution of arrests by race/ethnicity at stations with > 100 arrests.

Hint: see R code from class, section 8

```
