### INAF U6614: Data Analysis for Policy Research Using R

# **PROJECT GUIDELINES**

This document includes guidance for your project submissions organized into three sections: (1) details for your submitting your reports; (2) suggested paper outlines; and (3) grading guidelines.

# 1. Submitting project reports

Final projects must be submitted via Courseworks by December 18th (Friday), 11:59pm ET. If you are working in a team of two, only one student should submit on behalf of the team. No late submissions will be accepted. Your final report submission makes up 30% of your overall course grade, in addition to 20% from your project presentations.

You are required to submit the following:

- 1. A knitted .pdf file, along with the corresponding .rmd file used to generate it.
- 2. All input (raw) datasets compressed in a .zip file.
- 3. All *cleaned* data frames compressed in another .zip file. These will be the only datasets that you load directly into the .rmd file, not input data.
- 4. R scripts including all code that was *actually used* for your project work (not superfluous code) in another .zip file. Make sure to use comments liberally throughout your code.

Here are some guidelines to ensure a clear and reproducible submission:

- You (and the teaching team) should be able to execute the code in your R script(s) that inputs your *raw* datasets and generates the *cleaned* data frames used in your .rmd file.
- All data cleaning and preprocessing should be done in R scripts NOT in your .rmd file, so that your .rmd code chunks are streamlined and manageable. Your .rmd file should contain *minimal code* necessary to output tables, graphs, and statistics within your report.
- Knitting your .rmd file should produce the exact pdf you submit via CW, and only load the *cleaned* data frames that you actually use to generate your properly formatted .pdf report
- Whenever possible in your .rmd file, use in-line code references to statistics rather than hard-coding.

# Report length and formatting:

- The body of your report should contain a maximum of 8 single-spaced pages (excluding charts, tables, references and appendices); that's about 4,000 words.
- All tables and charts should be clearly titled, labelled and formatted, with notes to explain technical details as needed.
- We've provided a sample .rmd file with preferred formatting options. At a minimum, make sure you start with the YAML header included in **report template.rmd**.
- You may wish to include a Data Appendix in your .rmd file (that doesn't count towards the
  page/word count), to document additional details on your data sources and how your
  analysis variables were constructed. Here is an <a href="example">example</a> of a short data appendix for an
  online policy report, and another more detailed <a href="example">example</a> describing survey data.

# 2. Paper Outline

Here is a suggested outline for an empirical research paper you may use that aligns with many academic research papers. You will find this outline pre-typed in the report\_template.rmd.

#### Section 1: Introduction

• Clearly state your research questions. Motivate your study and describe the policy context.

#### Section 2: Background

• More policy background details (if necessary, otherwise fold into Section 1).

# Section 3: Data Description

 Describe data sources, representative population, and any other context the reader should know about the data as it pertains to the analysis you do. More details can be included in a Data Appendix.

## Section 4: Descriptive Statistics

- Describe the distribution of the key variables you're analyzing. Focus mostly on your treatment or policy variable(s) of interest and how they vary across relevant groups and/or time, as well as key covariates that need to be account for.
- For example, you should include difference-in-means tables or plots, and/or time series plots of key variables (by subgroups, when appropriate).

### Section 5: Empirical Strategy

 Carefully describe the econometric methods you use and main regression specifications using clear and unambiguous notation.

#### Section 6: Findings

Can be split into multiple sections if appropriate.

#### Section 7: Conclusion

- Summarize your key findings and policy implications of these findings.
- Discuss the limitations of your analysis and next steps.

#### Section 8: References

### Section 9: Appendices

 Use appendices for more detailed data description, and supplementary tables or charts that provide supporting information that is useful but not central for the story you are telling with your data.

If you prefer, an alternative outline that aligns with many policy or advocacy reports might replace some of the above sections with separate sections organized around key findings. You're free to make your own decisions regarding paper organization, this outline is just a good starting point.

# 3. Grading Guidance

This submission counts toward 30% of your overall course grade, further broken down as follows:

# Files are submitted according to Section 1 of this guideline (5%)

- For example, your .rmd file should not contain code for data cleaning.
- Make sure your report does not exceed the length requirements.

## R codes are properly and correctly written (20%)

- Use intuitive and readable variable names, with sufficient description and documentation.
- Code efficiently: if you find yourself repeating the same functions over and over, you may want to reconsider your approach.
- Only include necessary code, and generously use comments, tabs and white space to ensure readability.
- We should be able to run your code to reproduce the same results.

## Report is properly written and formatted (5%)

- Ensure your report is free of spelling, punctuation, or grammatical errors; absent of fragments, comma splices, and run-ons.
- Format your report for readability (e.g. sections should be clearly labeled, figures correctly placed, and all text clear and legible).
- Cite sources as needed (in-text and in the References section).

### **Motivation is clearly described** (5%)

- Clearly explain the policy context pertaining to your analysis, what you hope to learn, and why it is policy relevant.
- Provide sufficient background information for readers to understand the problem.

### Data is correctly (and succinctly) described and summarized (25%)

- Describe the data sources, key sampling issues and other data issues, and the representative population of interest.
- If applicable, describe important steps about how you arrived at your analysis datasets from the raw datasets (e.g. sample selection or aggregation) but make you describe in accessible terminology, not in terms of R functions.
- Clearly define and summarize key variables (outcome, policy variables and controls). Do
  not try to be exhaustive in presenting summary statistics; only show what you think the
  readers should know in order to follow along.
- Frame in policy-relevant terms, not just statistical terms.
- Ensure technical accuracy, and clear and precise use of statistical terms.
- Relegate technical details that are not necessary to emphasize to appendices.

### Methodology is statistically sound and properly answers the research questions (10%)

- Your analysis should inform the research question(s) of interest.
- Ensure technical accuracy, and clear and precise use of statistical terms.
- Describe your statistical methodology unambiguously in a policy-relevant language.

- DON'T SAY: "We ran an OLS regression to explore the relationship between arrests, race and poverty"
- DO SAY: "Next we estimate how fare evasion arrest intensity relates to poverty rates, and how this relationship differs between predominantly Black and non-Black subway station areas. To do this, we estimate the following regression equation separately for Black and non-Black station areas."

# **Presentation and visualization of findings (15%)**

- Include sufficient details on how you arrived at your findings. You can also use an appendix for additional details.
- Make sure the readers can easily follow your tables and charts, and understand the key takeaways.
  - Use clear axis labels and legend (if applicable); make sure the units are clear. Ask yourself: can the readers distinguish between plot markers and lines in the formatted .pdf you submitted?
  - Regression result specifications and results should be indicated clearly (in the text, chart notes, footnotes, and/or appendices).
- Ensure technical accuracy, and clear and precise use of statistical terms.

# Findings are correctly interpreted (10%)

- Ensure technical accuracy, and clear and precise use of statistical terms.
- Interpret your statistical findings in a policy-relevant language.
- Relate your findings with the research questions and policy.

### **Conclusion summarizes the key takeaways** (5%)

- Succinctly summarize the story of what we've learned from your analysis.
- Also discuss the limitations, possible next steps and policy implications of your research.
